

Metal Industry Indicators

Indicators of Domestic Primary Metals, Steel, Aluminum, and Copper Activity

November 2003

The primary metals leading index moved higher in October, and two of the other four metal industry leading indexes increased in September, the latest month for which they are available. The leading index of metal prices rose in September, its fifth increase in the past 6 months.

Based on preliminary data, the **primary metals leading index** increased 2.5% in October to 135.0 from a downwardly revised 131.7 in September. The index's 6-month smoothed growth rate rose to 8.7% from a revised 4.4% in September. The 6-month smoothed growth rate is a compound annual rate that measures the near-term trend. Normally, a growth rate above +1.0% signals an upward trend for future growth in metals activity, while a growth rate below -1.0% indicates a downward trend.

Only four of the index's eight components were available in time to compute the October index value; all four of those components increased. A strong gain in the Institute for Supply Management's PMI, an index of manufacturing activity, provided the largest contribution to the increase in the leading index. The PMI moved to its highest level since January 2000. The JOC-ECRI metals price index growth rate, which posted its largest increase in 19 months, also made a large contribution. The length of the average workweek in primary metals establishments and the stock price component both registered solid gains.

The September index value was revised downward with the addition of the four remaining components. In particular, a sharp decline in the growth rate of the inflation-adjusted U.S. M2 money supply, the largest since April 2002, pulled the leading index down.

The primary metals leading index has moved up strongly since last April, and its growth rate continues to point to an upturn in U.S. primary metals activity in the coming months.

The **steel leading index** fell 1.4% in September, moving down to 111.3 from a revised 112.9 in August. The September drop canceled out a similarly sized increase in August and left the index even with its level in July. The index's 6-month smoothed growth rate decreased to 1.9% from a revised 4.9% in August. Six of the leading index's nine components moved lower in September. The growth rate of the inflation-adjusted U.S. M2 money supply and retail sales of U.S. passenger cars and light trucks made the biggest negative contributions. A 1.1-hour

increase in the length of the average workweek in steel mills, the largest in 25 years, resulted in the greatest positive contribution to the net decrease in the index. Despite the September drop in the steel leading index, its growth rate still points to a turnaround in U.S. steel industry activity in the near term.

The **aluminum mill products leading index** fell 3.1% in September, the largest 1-month drop in this index since January 1987. The index's 6-month smoothed growth rate slumped to -2.5% from an upwardly revised 3.8% in August. Six of the index's seven components were available to compute the September index value, and all six moved lower. Like the steel leading index, the growth rate of the inflation-adjusted U.S. M2 money supply and retail sales of U.S. passenger cars and light trucks were responsible for most of the decline in the aluminum mill products leading index. The seventh index component, the length of the average workweek in aluminum sheet, plate, and foil establishments, posted a substantial increase in August. The aluminum mill products leading index has been volatile in recent months and is not giving a clear signal.

The **primary aluminum leading index** climbed 0.6% in September to 80.9 from a revised 80.4 in August, and its 6-month smoothed growth rate advanced to 5.8% from a revised 4.6% in August. Five of the index's six components were available for the September index calculation. The index measuring the trade-weighted average exchange value of other major currencies against the U.S. dollar was responsible for most of the net increase in the leading index. The growth rate of the primary aluminum leading index continues to point to a near-term increase in domestic primary aluminum industry activity.

In September, the **copper leading index** posted its sixth monthly increase in a row, as it advanced 0.3% to 120.1 from a revised 119.7 in August. The index's 6-month smoothed growth rate moved up to 4.7% from a revised 4.4% in August. Three of the leading index's six components, average weekly overtime hours in copper rolling, drawing, extruding, and alloying estab-

ishments; the S&P stock price index for building products companies; and the price of copper on the London Metal Exchange, increased in September. The growth rate of the copper leading index suggests an increasing near-term trend in domestic copper industry activity.

Metals Price Leading Index Advances in September

The metals price leading index advanced 0.4% to 112.5 in September, the latest month for which it is available, up from a revised 112.0 in August. The index's 6-month smoothed growth rate climbed to 2.6% from a revised 1.9% in August.

Three of the leading index's four components were available in time to compute the September index value. The growth rate of the index measuring the trade-weighted average exchange value of other major currencies against the U.S. dollar was responsible for most of the strength in the leading index. The growth rate of the inflation-adjusted value of new orders for U.S. nonferrous metal products registered a slight increase, while the yield

spread between the U.S. 10-year Treasury Note and the federal funds rate moved lower.

The fourth index component, the growth rate of the Economic Cycle Research Institute's (ECRI) 18-Country Long Leading Index, was available only through August. It decreased from a 10-month high reached in July.

The growth rate of the inflation-adjusted value of inventories of U.S. nonferrous metal products, which generally moves inversely with metal prices, slowed to -3.3% in September from a revised -2.2% in August.

The growth rate of the metals price leading index continues to signal an increase in overall primary metal prices in the coming months. The business cycle and inventories are only two factors in metals price determination. Other factors that affect prices include changes in metals production, speculation, strategic stockpiling, foreign exchange rates, geopolitical instability, and production costs.

Table 1.
Leading Index of Metal Prices and Growth Rates of the Nonferrous Metals Price Index, Inventories of Nonferrous Metal Products, and Selected Metal Prices

		Six-Month Smoothed Growth Rates				
	Leading Index of Metal Prices (1967=100)	MII Nonferrous Metals Price Index	U.S. Nonferrous Metal Products Inventories (1982\$)	Primary Aluminum	Primary Copper	Steel Scrap

NA: Not available r: Revised

Note: The components of the Leading Index of Metal Prices are the spread between the U.S. 10-year Treasury Note and the federal funds rate, and the 6-month smoothed growth rates of the deflated value of new orders for nonferrous metal products, the Economic Cycle Research Institute's 18-Country Long Leading Index, and the reciprocal of the trade-weighted average exchange value of the U.S. dollar against other major currencies. The Metal Industry Indicators (MII) Nonferrous Metals Price Index measures changes in end-of-the-month prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange (LME). The steel scrap price used is the price of No. 1 heavy melting. Inventories consist of the deflated value of finished goods, work in progress, and raw materials for U.S.-produced nonferrous metal products (NAICS 3313, 3314, & 335929). Six-month smoothed growth rates are based on the ratio of the current month's index or price to its average over the preceding 12 months, expressed at a compound annual rate.

Coincident: 1, Federal Reserve Board; 2, Bureau of Labor Statistics and U.S. Geological Survey; 3, U.S. Census Bureau and U.S. Geological Survey. All series are seasonally adjusted, except 2, 3, and 4 of the leading index.

NA: Not available **r:** Revised

Note: A component's contribution, shown in Tables 3, 5, 7, and 9, measures its effect, in percentage points, on the percent change in the index. Each month, the sum of the contributions plus the trend adjustment equals (except for rounding differences) the index's percent change from the previous month.

CHART 2.

PRIMARY METALS: LEADING AND COINCIDENT INDEXES, 1981-2003 1977=100

Shaded areas are business cycle recessions. Asterisks (*) signify peaks (the end of an expansion) and troughs (the end of a downturn) in the economic activity reflected by the indexes.

CHART 3.

PRIMARY METALS: LEADING AND COINCIDENT GROWTH RATES, 1981-2003 Percent

Shaded areas are business cycle recessions.

The growth rates are expressed as compound annual rates based on the ratio of the current month's index to its average level during the preceding 12 months.

CHART 10.

PRIMARY ALUMINUM LEADING AND COINCIDENT INDEXES, 1981-2003 1977=100

CHART 11.

PRIMARY ALUMINUM LEADING AND COINCIDENT GROWTH RATES, 1981-2003

The growth rates are expressed as compound annual rates based on the ratio of the current month's index to its average level during the preceding 12 months.

Explanation

Each month, the U.S. Geological Survey tracks the effects of the business cycle on five U.S. metal industries by calculating and publishing composite indexes of leading and coincident indicators. Wesley Mitchell and Arthur Burns originated the cyclical-indicators approach for the economy as a whole at the National Bureau of Economic Research in the mid-1930s. Over subsequent decades this approach was developed and refined, mostly at the National Bureau, under the leadership of Geoffrey H. Moore.¹

A business cycle can briefly be described as growth in the level of economic activity followed by a decline succeeded by further growth. These alternating periods of growth and decline do not occur at regular intervals. Composite indexes, however, can help determine when highs and lows in the cycle might occur. A composite index combines cyclical indicators of diverse economic activity into one index, giving decision makers and economists a single measure of how changes in the business cycle are affecting economic activity.

The indicators in the metal industry leading indexes historically give signals several months in advance of major changes in a coincident index, a measure of current metal industry activity. Indicators that make up the leading indexes are, for the most part, measures of anticipations or new commitments to various economic activities that can affect the metal industries in the months ahead.

Composite coincident indexes for the metal industries consist of indicators for production, shipments, and total employee hours worked. As such, the coincident indexes can be regarded as measures of the economic health of the metal industries.

The metal industry coincident indexes reflect industry activity classified by the U.S. Standard Industrial Classification (SIC) and the North American Industry Classification System (NAICS). Of the five metal industries, primary metals (NAICS 331) is the broadest, containing 25 different metal processing industries. Steel, aluminum, and copper are specific industries within the primary metals group.

The SIC was the main vehicle used by the U.S. Government and others in reporting industry economic statistics throughout most of the last century. Starting with the 1997 U.S. Economic Census, the U.S. Government began using the NAICS, which classifies economic data for industries in Canada, Mexico, and the United States. In general, metal industry indexes starting in 1997 begin to reflect the NAICS classification, while indexes for earlier years follow the SIC. Hence, composite indexes from 1997 forward are not entirely consistent with those of earlier years.

The largest change to primary metals because of the NAICS deals with other communication and energy wire manufacturing (NAICS 335929). Under NAICS, this manufacturing has been removed from primary metals and added to electrical equipment, appliance, and component manufacturing. Because monthly shipments and new orders for this wire are not available, the USGS is estimating their values from 1997 onward and adding them to the appropriate metal industry indicators and indexes to maintain consistency.

¹**Business Cycle Indicators, A monthly report from The Conference Board** (March 1996).

There are other small changes to the primary metals industry because of the switch to the NAICS. Coke oven activity not done by steel mills, for example, is removed and alumina refining, a part of industrial inorganic chemical manufacturing under the SIC, is added. Since the historic trends of the composite indexes are not affected by these small changes, the USGS is not making specific adjustments to the indexes for them for the periods before and after 1997.

The metal industry leading indexes turn before their respective coincident indexes an average of 8 months for primary metals and 7 months for steel and copper. The average lead time for the primary aluminum leading index is 6 to 8 months, and the average lead time for the aluminum mill products leading index is 6 months.

The leading index of metal prices, also published in the *Metal Industry Indicators*, is designed to signal changes in a composite index of prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange. On average, this leading index indicates significant changes in price growth about 8 months in advance.

The growth rate used in the *Metal Industry Indicators* is a 6-month smoothed growth rate at a compound annual rate, calculated from a moving average. Moving averages smooth fluctuations in data over time so that trends can be observed. The 6-month smoothed growth rate is based upon the ratio of the latest monthly value to the preceding 12-month moving average.

$$\left[\left(\frac{\text{current value}}{\text{preceding 12-month moving average}} \right)^{\frac{12}{6.5}} - 1.0 \right] * 100$$

Because the interval between midpoints of the current month and the preceding 12 months is 6.5 months, the ratio is raised to the 12/6.5 power to derive a compound annual rate.

The growth rates measure the near-term industry trends. They, along with other information about the metal industries and the world economy, are the main tools used to determine the outlook of the industries. A 6-month smoothed growth rate above +1.0% usually means increasing growth; a rate below -1.0% usually means declining growth.

The next summary is scheduled for release on the World Wide Web at 10:00 a.m. EST, Friday, December 19. The address for *Metal Industry Indicators* on the World Wide Web is: <http://minerals.usgs.gov/minerals/pubs/mii/>

The *Metal Industry Indicators* is produced at the U.S. Geological Survey by the Minerals Information Team. The report is prepared by Kenneth Beckman (703-648-4916; e-mail: kbeckman@usgs.gov), and Gail James (703-648-4915; e-mail: gjames@usgs.gov). The former Center for International Business Cycle Research, under the direction of Dr. Geoffrey H. Moore, and the former U.S. Bureau of Mines developed the metal industry leading and coincident indexes in the early 1990s. Customers can send mail concerning the *Metal Industry Indicators* to the following address:
